

EDUCATE Portal - Project Documentation

1. Problem Statement

Traditional educational certificates and identity cards are highly susceptible to forgery, tampering, and physical damage. Verifying the authenticity of paper-based or even conventional digital documents involves tedious, manual processes that are time-consuming and inefficient for employers and institutions. For academic institutions, prospective employers, and third-party verifiers, confirming the authenticity of these records currently requires tedious, manual background checks that are costly, slow, and inefficient.

There is a critical need for a decentralized, secure, and instantly verifiable system for academic credentials and student identity to ensure trust and transparency. To resolve these vulnerabilities, modern educational infrastructure requires a decentralized, tamper-proof system capable of guaranteeing permanent document integrity and real-time verification without relying on centralized single points of failure.

2. Project Proposal & Solution Architecture

3. Features

- **Admin Dashboard:** Comprehensive management tools for creating courses, managing batches, enrolling students, scheduling exams, processing results, issuing certificates, and approving/minting digital ID cards.
- **Candidate Dashboard:** A personalized portal for students to view enrolled courses, track upcoming exams, check semester results, request blockchain-backed ID cards, and access their verified certificates.
- **Dynamic Result & Grade Management:** Detailed management of marks and subjects dynamically based on the course type:
 - **Certificate Courses:** Direct evaluation with 2 core subjects.
 - **Diploma/Graduation Courses:** Semester-based evaluation featuring 5 subjects per semester. The final consolidated certificate is only generated after all semesters are successfully completed.
- **Blockchain-based Document Verification:** Generates a cryptographic hash of certificate, ID card, and individual semester result details, securely storing them on the Ethereum blockchain. This ensures absolute immutability and verifiable authenticity.
- **Decentralized Trust:** Secures academic credentials, semester results, and student identity on an immutable ledger, preventing unauthorized modifications.

4. Project Proposal with Feasibility Study

Proposal: To develop a decentralized education portal leveraging the MERN stack for robust data management and Web3 blockchain technology (Ethereum) to issue, store, and verify immutable academic certificates, ID cards, and semester-by-semester results.

Feasibility Study:

- **Technical Feasibility:** High. The MERN stack (MongoDB, Express, React, Node) is a proven architecture for scalable web applications. Ethereum and Hardhat provide an established ecosystem for smart contract development.
- **Operational Feasibility:** High. The user interface is designed to abstract blockchain complexities, making it user-friendly for non-technical administrators and students to request and mint Web3 documents.
- **Economic Feasibility:** The project utilizes local testnets (Hardhat) during development to ensure zero gas costs. For production, optimized smart contracts will minimize transaction fees (gas), making it a cost-effective solution for institutions.

5. System Analysis

The system operates around three primary domains: Administration, Student Portal, and the Blockchain Network.

- **Admin Domain:** Manages the core educational workflows—from course creation to ID card approvals, semester result uploads, and final certificate issuance.
- **Candidate Domain:** Allows students to access their educational records, request Web3 ID cards, view individual semester results, and access cryptographic certificates upon course completion.
- **Blockchain Domain:** Acts as the immutable ledger. When an ID card, semester result, or final certificate is generated, its unique hash and transaction details are permanently recorded on the blockchain.

6. Architecture Used

The system utilizes a hybrid Client-Server and Decentralized Web3 Architecture:

- **Frontend (Client):** React.js, Vite, and Bootstrap for a responsive, dynamic User Interface.
- **Backend (Server):** Node.js and Express.js providing RESTful APIs.
- **Database:** MongoDB with Mongoose ODM for structured data storage (Courses, Students, Exams, Results, ID Cards, etc.).
- **Blockchain:** Ethereum Network, Solidity Smart Contracts, Hardhat (local Ethereum node), and Ethers.js/Web3.js for seamless backend-to-blockchain communication.

7. Project Flow Using SDLC (Software Development Life Cycle)

1. **Requirement Analysis:** Identifying the vulnerability of traditional credentials and defining the need for a blockchain-based verification system.
2. **Design:** Architecting the database schemas (MongoDB), smart contract logic (Solidity), and UI/UX wireframes (React) to handle varying course types.
3. **Implementation/Coding:** Developing the REST APIs, building frontend components, and writing/deploying smart contracts.
4. **Testing:** Unit testing individual components, smart contract testing on the Hardhat node, and end-to-end integration testing.
5. **Deployment:** Deploying the frontend (e.g., Vercel), backend (e.g., AWS/Render), database (MongoDB Atlas), and smart contracts to an Ethereum testnet/mainnet.
6. **Maintenance:** Monitoring system health, managing database backups, and updating UI components based on user feedback.

8. Project Flow with Process

1. **Setup:** Admin creates a new Course (specifying if it is a Certificate or Diploma/Degree) and initializes a Batch.
2. **Onboarding:** Candidates sign up on the portal. Admin approves and assigns them to the active Batch.
3. **ID Card Request & Issuance:**
 - Candidate requests an ID card from their dashboard.
 - Admin reviews pending ID card requests, approves, and mints the ID card to the Ethereum blockchain.
4. **Examination:** Admin schedules an Exam for the specific batch and semester.
5. **Evaluation & Result Minting:**
 - Admin uploads the Results (marks, subjects, grades) for the candidates.
 - **For Certificate courses:** 2 subjects are evaluated.
 - **For Diploma/Graduation courses:** 5 subjects are evaluated per semester.
 - *Crucially, each semester's result data is immediately anchored to the Ethereum Blockchain as an immutable record.*
6. **Final Certificate Issuance:**
 - For Certificate courses, the certificate is generated immediately after the single exam result.
 - For Diploma/Graduation courses, the system ensures all requisite semesters are completed before the Admin can generate the final consolidated Certificate.
7. **Certificate Blockchain Anchoring:** The system calculates a cryptographic hash of the final certificate data and initiates a transaction to store it on the Ethereum Blockchain.

8. **Verification:** Any third party can verify the authenticity of a Certificate, ID Card, or a specific Semester Result in real-time by querying the blockchain using the unique ID or scanning the generated QR code.

9. Entity-Relationship Diagram (ERD)

10. Data Flow Diagrams (DFD)

Level 0 DFD (Context Diagram)

Level 1 DFD (Main Processes)

Level 2 DFD (Document Generation Process)

11. Testing

- **Unit Testing:** Isolating and testing individual React components (e.g., Dashboard metrics) and backend controllers (e.g., User authentication logic).
- **Smart Contract Testing:** Utilizing Hardhat and Chai to rigorously test the immutability, event emission, and retrieval functions of the Solidity contracts before deployment (including Certificate, IdCard, and Result minting functions).
- **Integration Testing:** Ensuring the Node.js backend correctly synchronizes data writes between MongoDB and the Ethereum node without race conditions.
- **Security Testing:** Auditing for common Web3 vulnerabilities (e.g., Reentrancy, Overflow) and traditional web vulnerabilities (e.g., XSS in React, NoSQL injection in MongoDB).

12. Deployment

- **Frontend Architecture:** Deployed as a static bundle using services like Vercel, Netlify, or AWS S3 & CloudFront for fast global delivery.
- **Backend Architecture:** Hosted on scalable platforms like AWS EC2, Heroku, or Render to handle API requests and blockchain interactions.
- **Database Layer:** Managed MongoDB Atlas cluster for a highly available, scalable NoSQL database.
- **Blockchain Layer:** Smart contracts are deployed to an Ethereum testnet (e.g., Sepolia) or Mainnet. The backend communicates with the network via RPC providers like Infura or Alchemy.

13. Security

- **Data Integrity (Blockchain):** The primary security feature. Once a document's hash is anchored to the Ethereum blockchain, it is mathematically impossible to alter without invalidating the hash, guaranteeing authenticity.
- **Authentication & Authorization:** Role-based access control (Admin vs. Candidate) implemented using secure JWT (JSON Web Tokens) or session management.
- **Data Privacy:** Sensitive personal details (PII) are stored securely in MongoDB. Only the non-reversible cryptographic hash and public identifiers are exposed on the public blockchain, ensuring GDPR compliance.
- **Input Validation:** Strict Mongoose schemas and backend validation middleware enforce data types and constraints to prevent NoSQL injection and malformed data entry.

Prerequisites

Before installing the dependencies, ensure you have the following installed on your system:

- Node.js (v16.x or higher recommended)
- npm (Node Package Manager)

Step 1: Backend Dependencies

Navigate to the backend directory and install the necessary packages:

```
cd backend  
npm install
```

Dependencies:

- cors: Middleware to enable Cross-Origin Resource Sharing.
- ethers: Library for interacting with the Ethereum Blockchain.
- express: Fast, unopinionated, minimalist web framework for Node.js.
- mongoose: MongoDB object modeling tool.
- multer: Node.js middleware for handling file uploads.

Step 2: Frontend Dependencies

Navigate to the frontend directory and install the necessary packages:

```
cd frontend  
npm install
```

Dependencies:

- bootstrap: CSS framework for responsive design.
- ethers: Library for interacting with the Ethereum Blockchain.
- html2canvas: Takes "screenshots" of webpages to build the certificate visually.
- jspdf: Library to generate PDFs (used for downloading documents).
- qrcode.react: React component to generate QR codes for verification.
- react & react-dom: Core React libraries for building the UI.
- react-router-dom: Declarative routing for React web applications.

Dev Dependencies: Tools and plugins related to Vite, ESLint, and TypeScript declarations (@eslint/js, @vitejs/plugin-react, vite, etc.) for development.

Step 3: Ethereum (Blockchain) Dependencies

Navigate to the ethereum directory and install the necessary packages:

```
cd ethereum  
npm install
```

Dev Dependencies:

- @nomicfoundation/hardhat-toolbox: Bundles all the commonly used Hardhat plugins.
- hardhat: Ethereum development environment for compiling, testing, and deploying smart contracts locally.

Dependencies: Various low-level tools required by the Ethereum ecosystem (adm-zip, ethereum-cryptography, micro-eth-signer, tsx, zod, etc.).

Instructions

Note: Your development servers are currently running for all three modules (npx hardhat node, npm start for backend, and npm run dev for frontend).

1. Ethereum Directory

Go to the Ethereum directory to start the local blockchain node (Ganache/Hardhat):

```
cd .\ethereum\  
npx hardhat node
```

Open another terminal for the Ethereum directory to deploy the smart contract to the local network:

```
cd .\ethereum\  
npx hardhat run scripts/deployCertificate.js --network localhost
```

2. Backend Directory

Start the backend server:

```
cd .\backend\  
npm start
```

3. Frontend Directory

Start the frontend development server:

```
cd .\frontend\  
npm run dev
```

The frontend should be accessible at <http://localhost:5173/>.

Repository Link

<https://github.com/saikatssg/student-education-portal/tree/main>

```
cd .\frontend\  
npm run dev
```

The frontend should be accessible at `http://localhost:5173/`.

DISCOVER OUR PLATFORM

Empowering Students Through Decentralization

The EDUCATE platform bridges the gap between traditional learning and modern blockchain technology. We offer an intuitive portal for students to manage their courses while ensuring their achievements are securely minted on the Web3 ecosystem.

By leveraging Ethereum smart contracts, we provide immutable, verifiable certificates that employers can trust instantly. No more paper records, no more third-party background checks—just pure, decentralized validation.
